

Computer Networks

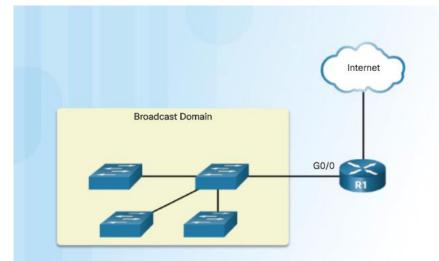

Lecture 8

Prof. Dr. Essam Halim Houssein Faculty of Computers and Information Wiffinia University

Network Segmentation

Broadcast Domains

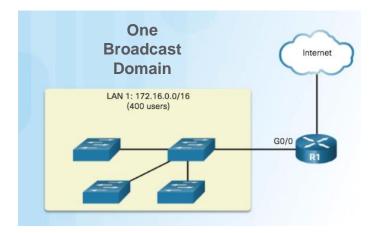

- Devices use broadcasts in an Ethernet LAN to locate:
 - Other devices Address Resolution Protocol (ARP) which sends Layer 2 broadcasts to a known IPv4
 address on the local network to discover the associated MAC address.
 - Services Dynamic Host Configuration Protocol (DHCP) which sends broadcasts on the local network to locate a DHCP server.
- Switches propagate broadcasts out all interfaces except the interface on which it was received.

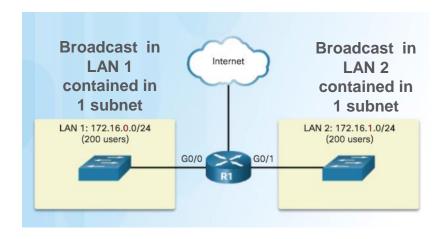

Network Segmentation

Problems with Large Broadcast Domains

- Hosts can generate excessive broadcasts and negatively affect the network.
 - Slow network operations due to the significant amount of traffic it can cause.
 - Slow device operations because a device must accept and process each broadcast packet.
- Solution: Reduce the size of the network to create smaller broadcast domains. These smaller network spaces are called *subnets*.

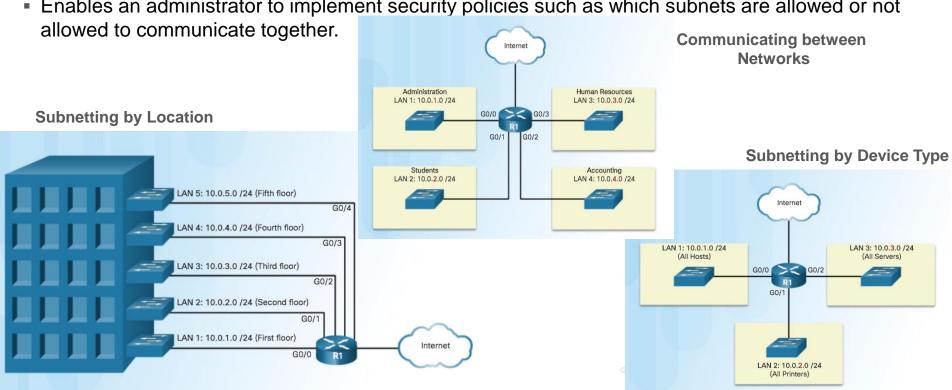

Network Segmentation

Reasons for Subnetting

Reduces overall network traffic and improves network performance.

Enables an administrator to implement security policies such as which subnets are allowed or not

Octet Boundaries

Networks are most easily subnetted at the octet boundary of /8, /16, and /24

Prefix Length	Subnet Mask	Subnet Mask in Binary (n = network, h = host)	# of hosts
/8	255.0.0.0	nnnnnnn.hhhhhhhh.hhhhhhh.hhhhhhh 1111111.00000000.00000000.00000000	16,777,214
/16	255.255.0.0	nnnnnnn.nnnnnnnn.hhhhhhhh.hhhhhhh 11111111.11111111.00000000.00000000	65,534
/24	255.255.255.0	nnnnnnn.nnnnnnnn.nnnnnnn.hhhhhhh 11111111.11111111.11111111.00000000	254

- Prefix length and the subnet mask are different ways of identifying the network portion of an address.
- Subnets are created by borrowing host bits for network bits.
- More host bits borrowed, the more subnets that can be defined.

Subnetting on the Octet Boundary

Subnet Address (256 Possible Subnets)	Host Range (65,534 possible hosts per subnet)	Broadcast
<u>10.0</u> .0.0/16	<u>10.0</u> .0.1 - <u>10.0</u> .255.254	<u>10.0</u> .255.255
<u>10.1</u> .0.0/16	<u>10.1</u> .0.1 - <u>10.1</u> .255.254	<u>10.1</u> .255.255
<u>10.2</u> .0.0/16	<u>10.2</u> .0.1 - <u>10.2</u> .255.254	<u>10.2</u> .255.255
<u>10.3</u> .0.0/16	<u>10.3</u> .0.1 - <u>10.3</u> .255.254	<u>10.3</u> .255.255
<u>10.4</u> .0.0/16	<u>10.4</u> .0.1 - <u>10.4</u> .255.254	<u>10.4</u> .255.255
<u>10.5</u> .0.0/16	<u>10.5</u> .0.1 - <u>10.5</u> .255.254	<u>10.5</u> .255.255
<u>10.6</u> .0.0/16	<u>10.6</u> .0.1 - <u>10.6</u> .255.254	<u>10.6</u> .255.255
<u>10.7</u> .0.0/16	<u>10.7</u> .0.1 - <u>10.7</u> .255.254	<u>10.7</u> .255.255
<u>10.255</u> .0.0/16	<u>10.255</u> .0.1 - <u>10.255</u> .255.254	<u>10.255</u> .255.255

- Subnetting Network 10.x.0.0/16
- Define up to 256 subnets with each subnet capable of connecting 65,534 hosts.
- First two octets identify the network portion while the last two octets are for host IP addresses.

Subnetting on the Octet Boundary (Cont.)

Subnet Address (65,536 Possible Subnets)	Host Range (254 possible hosts per subnet)	Broadcast
		10.0.0.055
<u>10.0.0</u> .0/24	<u>10.0.0</u> .1 - <u>10.0.0</u> .254	<u>10.0.0</u> .255
<u>10.0.1</u> .0/24	<u>10.0.1</u> .1 - <u>10.0.1</u> .254	<u>10.0.1</u> .255
10.0.2.0/24	<u>10.0.2</u> .1 - <u>10.0.2</u> .254	10.0.1.255
10.0.255.0/24	<u>10.0.255</u> .1 - <u>10.0.255</u> .254	10.0.255.255
<u>10.1.0</u> .0/24	<u>10.1.0</u> .1 - <u>10.1.0</u> .254	<u>10.1.0</u> .255
<u>10.1.1</u> .0/24	<u>10.1.1</u> .1 - <u>10.1.1</u> .254	<u>1.1.1.0</u> .255
10.1.2.0/24	<u>10.1.2</u> .1 - <u>10.1.2</u> .254	10.1.2.0.255
<u>10.100.0</u> .0/24	<u>10.100.0</u> .1 - <u>10.100.0</u> .254	<u>10.100.0</u> .255
<u>10.255.255</u> .0/24	<u>10.255.255</u> .1 - <u>10.255.255</u> .254	<u>10.255.255</u> .255

- Subnetting Network 10.x.x.0/24
- Define 65,536 subnets each capable of connecting 254 hosts.
- /24 boundary is very popular in subnetting because of number of hosts.

Classless Subnetting

Subnetting a /24 Network

Prefix Length	Subnet Mask	Subnet Mask in Binary (n = network, h = host)	# of subnets	# of hosts
/25	255.255.255.128	nnnnnnn.nnnnnnnn.nnnnnnn.nhhhhhh 11111111.1111111111	2	126
/26	255.255.255.192	nnnnnnn.nnnnnnnn.nnnnnnn.nnhhhhhh 11111111.1111111111	4	62
/27	255.255.255.224	nnnnnnn.nnnnnnnn.nnnnnnn.nnnhhhhh 11111111.1111111111	8	30
/28	255.255.255.240	nnnnnnn.nnnnnnnn.nnnnnnn.nnnnhhhh 11111111.1111111111	16	14
/29	255.255.255.248	nnnnnnn.nnnnnnnn.nnnnnnn.nnnnnhhh 11111111.1111111111	32	6
/30	255.255.255.252	nnnnnnn.nnnnnnnn.nnnnnnn.nnnnnnhh 11111111.1111111111	64	2

Subnets can borrow bits from *any* host bit position to create other masks.

Video Demonstration – The Subnet Mask

Subnetting in Binary

- ANDING
 - Convert IP address and Subnet Mask to Binary (line up vertically like an addition problem)
 - Logically AND (1 and 1 = 1, all other combinations = 0)
 - Result is network address for original IP address
- Classful Subnetting
 - Class A /8 255.0.0.0
 - Class B /16 255.255.0.0
 - Class C /24 255.255.255.0

Video Demonstration – The Subnet Mask (Cont.)

Subnetting 192.168.1.0/24

Subnetting Based On Network Requirements

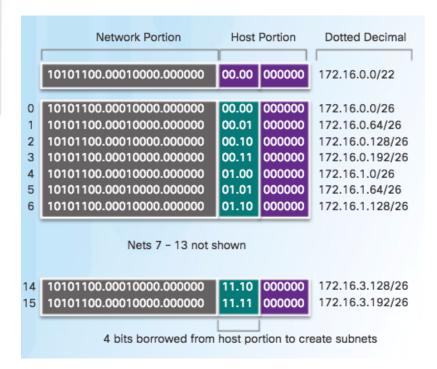

Host devices used by employees in the Engineering department in one network and Management in a separate network.

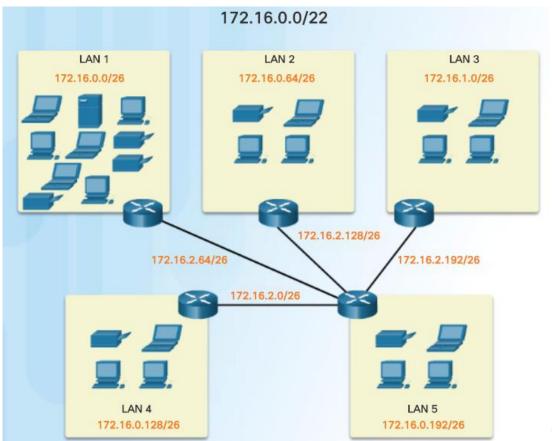

Network Requirement Example

Network Requirement Example (Cont.)

Lab – Calculating IPv4 Subnets

Mind Wide Open*

Lab - Calculating IPv4 Subnets

Objectives

Part 1: Determine IPv4 Address Subnetting

Part 2: Calculate IPv4 Address Subnetting

Background / Scenario

The ability to work with IPv4 subnets and determine network and host information based on a given IP address and subnet mask is critical to understanding how IPv4 networks operate. The first part is designed to reinforce how to compute network IP address information from a given IP address and subnet mask. When given an IP address and subnet mask, you will be able to determine other information about the subnet.

Required Resources

- 1 PC (Windows 7 or 8 with Internet access)
- Optional: IPv4 address calculator

Part 1: Determine IPv4 Address Subnetting

In Part 1, you will determine the network and broadcast addresses, as well as the number of hosts, given an IPv4 address and subnet mask.

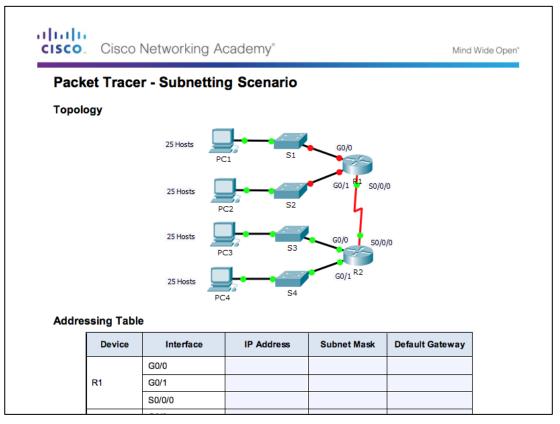

REVIEW: To determine the network address, perform binary ANDing on the IPv4 address using the subnet mask provided. The result will be the network address. Hint: If the subnet mask has decimal value 255 in an octet, the result will ALWAYS be the original value of that octet. If the subnet mask has decimal value 0 in an octet, the result will ALWAYS be 0 for that octet.

Example:

IP Address 192.168.10.10
Subnet Mask 255.255.255.0
========
Result (Network) 192.168.10.0

Subnetting to Meet Requirements

Traditional Subnetting Wastes Addresses

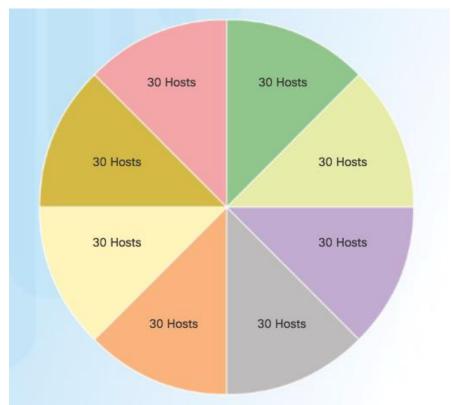

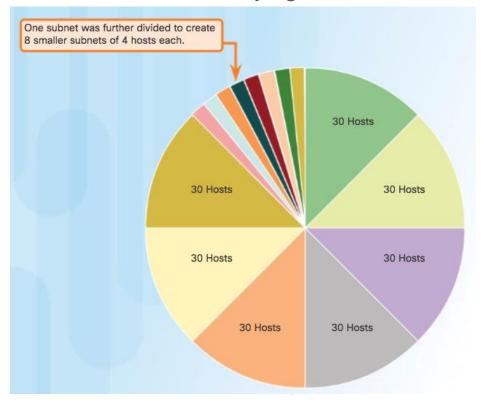

Variable Length Subnet Masks (VLSM)

Traditional

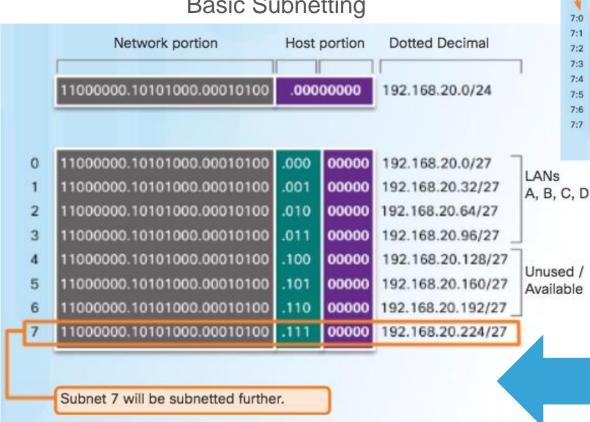

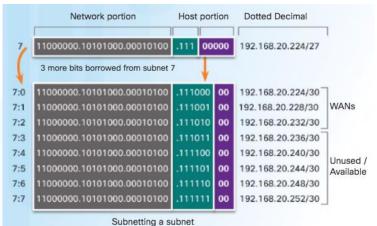

Subnets of Varying Sizes

Benefits of Variable Length Subnet Masking **Basic VLSM**

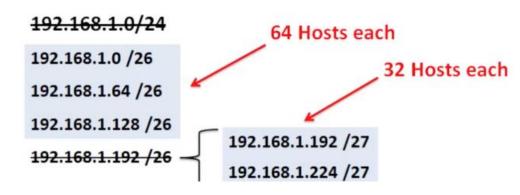

Basic Subnetting

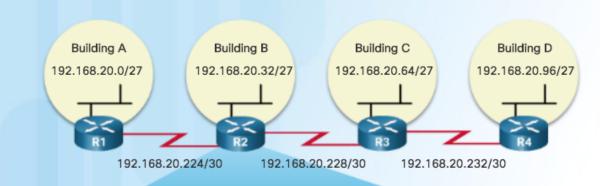

Video Demonstration – VLSM Basics

- Basic VLSM
 - Subnets do not have to be equal sizes, as long as their address ranges do not overlap.
 - When creating subnets it is easier to work from larger to smaller.

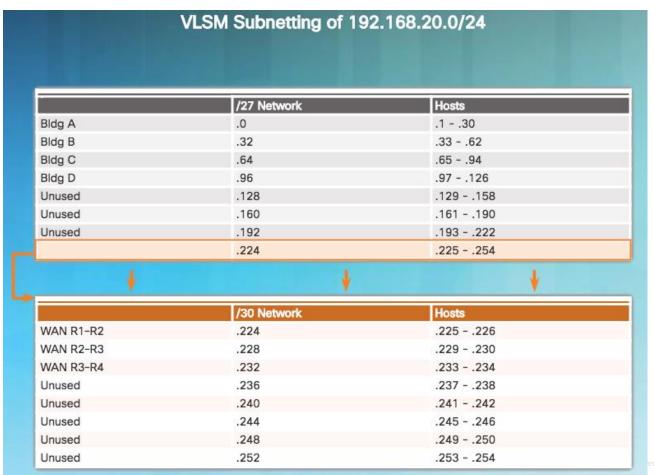

VLSM in Practice

```
R2(config)# interface gigabitethernet 0/0
R2(config-if)# ip address 192.168.20.33 255.255.255.224
R2(config-if)# exit
R2(config)# interface serial 0/0/0
R2(config-if)# ip address 192.168.20.226 255.255.252
R2(config-if)# exit
R2(config)# interface serial 0/0/1
R2(config)# ip address 192.168.20.229 255.255.252
R2(config-if)# end
R2#
```

VLSM Chart

Video Demonstration – VLSM Example

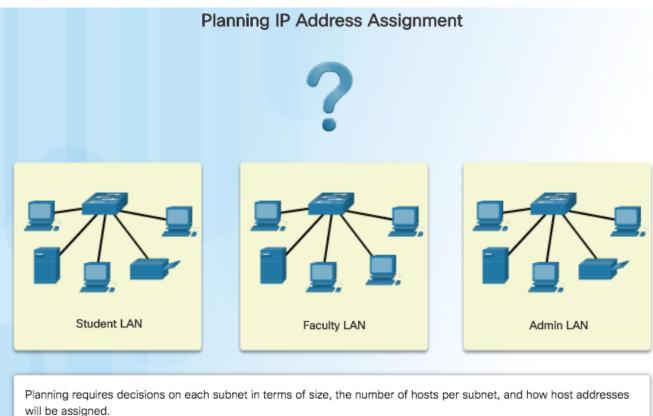

- Given the network 172.16.0.0/23 creates subnets:
 - 1 network for 200 hosts 256
 - 1 network for 100 hosts 128
 - 1 network for 50 hosts 64
 - 1 network for 25 hosts 32
 - 1 network for 10 hosts 16
 - 4 point-to-point networks for 2 hosts each – 4x4 = 16

```
/23 = 2^9 hosts = 512
256+128+64+32+16+16 = 512 hosts needed
Address range 172.16.0.0 - 172.16.1.255
```

                                                                      VLBM Example
```

8.2 Addressing Schemes

Network Address Planning

allialia CISCO

Planning to Address the Network

- Each host in an internetwork must have a unique address.
- Need proper planning & documentation.
- Must provide & control access to servers from internal hosts and external hosts.
- Layer 3 STATIC address assigned to a server can be used to control access to that server.
- Monitoring security and performance of hosts means network traffic is examined for source IP addresses that are generating or receiving excessive packets.

Assigning Addresses to Devices

- Devices that require addresses:
 - End user clients
 - Can be set for DHCP to save time and manual errors.
 - A change in the subnetting scheme requires reconfiguration of DHCP server. IPv6 clients use DHCPv6/SLAAC.

Servers

- Configured with static addresses.
- Private addresses translated to public addresses if accessible from the Internet.

Intermediary devices

 Set with static addresses for remote management.

Gateway

• Router interface used to exit the network.

Network: 192.168.1.0/24				
Use	First	Last		
Host Devices	.1	.229		
Servers	.230	.239		
Printers	.240	.249		
Intermediary Devices	.250	.253		
Gateway (router LAN interface)	.254			

Packet Tracer – Designing and Implementing a VLSM Addressing Scheme

Topology

You will receive one of three possible topologies.

Addressing Table

Device	Interface	IP Address	Subnet Mask	Default Gateway
	G0/0			N/A
	G0/1			N/A
	S0/0/0			N/A
	G0/0			N/A
	G0/1			N/A
	S0/0/0			N/A
	VLAN 1			
	NIC			

Objectives

Part 1: Examine the Network Requirements

Part 2: Design the VLSM Addressing Scheme

Part 3: Assign IP Addresses to Devices and Verify Connectivity

Lab – Designing and Implementing a VLSM Addressing Scheme
